ACKNOWLEDGEMENT

First of all, we thank the almighty for providing us strength and courage to present the project. We avail this opportunity to express our sincere gratitude towards **Prof. Chintan N. Kanani, Head of Computer Engineering Department** for permitting us to conduct the project.

We express our cavernous sense of obligation and gratitude to our Guide **Prof. Neeraj H. Ahuja** for his genuine guidance and constant encouragement throughout this project work. We are highly obliged to our honorable guide for providing us with such an opportunity to carry out research work under his continuous guidance.

Also, we are very thankful to Darshan University Computer Department faculties who supported us in getting our website ready. We also wish to express our heartfelt appreciation to our family, colleagues and many who have rendered their support for the successful works towards the completion of the research work, both explicitly and implicitly.

We also thank to our friends who suggested right way for the improvement of our project, they gave us complete support for the construction of our project according to guideline. We deeply acknowledge mutually to all project supporter for their never ending encouragement, moral support and patience during the preparation of this project.

ABSTRACT

Green Gyan is a plant information and management system developed to provide a centralized and user-friendly platform for accessing plant-related knowledge. The main objective of this project is to simplify the process of searching, viewing, and managing plant information for users, while also providing administrative control for maintaining accurate and organized data. The system allows users to register, log in, search plants, view detailed plant descriptions, explore categories, and manage a personalized wishlist. On the other hand, administrators can manage plant records, categories, and user details efficiently through a secure login system.

1. INTRODUCTION

1.1 PROBLEM SUMMRY

1.1.1 Problem Identification

This project is titled **Green Gyan**. Green Gyan is a plant information and management application designed to spread knowledge about plants and make plant-related information easily accessible to users. The main objective of this system is to provide a simple, informative, and user-friendly platform where users can explore different plants, understand their characteristics, care instructions, and categories, and manage their personal plant wishlist. At the same time, administrators can efficiently manage plant records, categories, and user information. Green Gyan acts as a digital guide for plant lovers, beginners, and nature enthusiasts. Instead of searching information from multiple sources, users can rely on a single platform to gain accurate and organized plant knowledge. The system ensures smooth interaction between users and administrators while maintaining data accuracy and security

1.1.2 Problem Solution

In the traditional system, information related to plants is scattered across books, websites, and local nurseries. Users often face difficulties in finding reliable and complete information about plants such as categories, scientific names, care instructions, light requirements, and difficulty levels. Searching plant data manually is time-consuming and confusing, especially for beginners. From the management side, maintaining plant records, categories, and user details manually is inefficient and error-prone. Updating information, removing outdated records, and handling multiple users becomes difficult without a proper system. There is no centralized platform that allows both users and administrators to manage plant-related data effectively. Green Gyan provides an effective solution by offering a centralized digital system for plant information management. Users can easily register and log in to the system, search for plants, view detailed plant information, browse categories, and add plants to their wishlist. The simple interface makes it easy for users of all age groups to use the application without difficulty. Administrators can securely log in and manage plant details, categories, and user information through an organized dashboard. This reduces

manual effort, improves data accuracy, and saves time. The system ensures that all plant-related information is stored in a structured database and can be accessed quickly whenever required.

2. PLANNING

2.1 MODEL DESCRIPTION

Fig 2.1 Iterative Waterfall Model

- In our project we are using iterative waterfall model.
- It is not possible to strictly follow the classical waterfall model.
- Making necessary changes to the classical waterfall model so that it becomes applicable to practical software development projects.
- The main change to the classical waterfall model is in the form of providing feedback paths from every phase to its preceding phases as shown in figure.
- The feedback paths allow for correction of the errors committed during a phase as and when these are detected in a later phase.
- For example, if during testing a design error is identified then the feedback path allows the design to be reworked and the changes to be reflected in the design document.
- There is no feedback path to the feasibility stage. This means that the feasibility study errors cannot be corrected.

Requirements analysis and specification

- The aim of the requirements analysis and specification phase is to understand the exact requirements of the customer and to document them properly. This phase consists of two distinct activities, namely
 - Requirements gathering and analysis, and
 - Requirements specification
- The goal of the requirements gathering activity is to collect all relevant information from the customer regarding the product to be developed. This is done to clearly understand the customer requirements so that incompleteness and inconsistencies are removed.
- The requirements analysis activity is begun by collecting all relevant data regarding the product to be developed from the users of the product and from the customer through interviews and discussions.
- During SRS activity, the user requirements are systematically organized into a Software Requirements Specification (SRS) document.

Design

- During the design phase the software architecture is derived from the SRS document. Two distinctly different approaches are available.
- Traditional design consists of two different activities; first a structured analysis of the requirements specification is carried out where the detailed structure of the problem is examined. During structured design, the results of structured analysis are transformed into the software design.

Coding and unit testing (Implementation)

- The purpose of the coding and unit testing phase of software development is to translate the software design into source code. Each component of the design is implemented as a program module. The end-product of this phase is a set of program modules that have been individually tested.
- Each module is unit tested for determine the correct working of all the individual modules.

Integration and system testing

- Integration of different modules is done once they have been coded and unit tested. During the integration and system testing phase, the modules are integrated in a planned manner.

- Finally, when all the modules have been successfully integrated and tested, system testing is carried out. The goal of system testing is to ensure that the developed system conforms to its requirements laid out in the SRS document. System testing usually consists of three different kinds of testing activities.
- α – testing: It is the system testing performed by the development team.
- β – Testing: It is the system testing performed by a friendly set of customers.
- Acceptance testing: It is the system testing performed by the customer himself after the product delivery to determine whether to accept or reject the delivered product.

Maintenance

- Maintenance involves performing any one or more of the following three kinds of activities:
 - Correcting errors that were not discovered during the product development phase. This is called corrective maintenance.
 - Improving the implementation of the system, and enhancing the functionalities of the system according to the customer's requirements. This is called perfective maintenance.
 - Porting the software to work in a new environment. For example, porting may be required to get the software to work on a new computer platform or with a new operating system. This is called adaptive maintenance.

2.2 Risk Management

- The aim of risk management is to reducing the impact of all kind of risks that might affect a project. Risk management consists of three essential activities: risk identification, risk assessment, and risk containment.

Risk Identification

- A software project can be affected by a large variety of risks. In order to be able to systematically identify the important risks which might affect a software project, it is necessary to categorize risks into different classes.
- The project manager can then examine which risks from each class are relevant to the project. There are three main categories of risks which can affect a software project:

Project Risks

- Project risks concern varies forms of budgetary, schedule, personnel, resource, and customer-related problems. An important project risk is schedule. It is very difficult to monitor and control a software project.

- It is very difficult to control something which cannot be seen.
- The invisibility of the product being developed is an important reason for many software projects failure.
- So in our project we are trying to resolve this kind of project risk which is also known as schedule risk.

Technical Risks

- Technical risks concern design, implementation, interfacing, testing, and maintenance problems.
- Technical risks also include ambiguous specification, incomplete specification, changing specification, technical uncertainty. Most technical risks occur due to the team member's insufficient knowledge about the project.
- So in order to prevent this risk, we have done appropriate project analysis before starting our project.

Business Risks

- This type of risks include risks of building an excellent product that no one wants, losing budgetary or personnel commitments, etc.

Risk Assessment

- Risk assessment involves identifying risk, analyzing them and then assigns priority to them on the basis of the analysis.
- The objective of risk assessment is to rank the risks in terms of their damage. For risk assessment, first each risk should be rated in two ways:
- The probability of a risk coming true (denoted as r).
- The result of the problems associated with that risk (denoted as s).
- Based on these two factors, the priority of each risk can be computed:

$$p = r * s$$

- Where, p is the priority with which the risk must be handled, r is the probability of the risk becoming true, and so is the result of damage caused due to the risk becoming true. If all identified risks are prioritized, then the most likely and damaging risks can be handled first and reject procedures can be designed for these risks.

Risk Containment

- After all the identified risks of a project are assessed, plans must be made to containment the most damaging and the most likely risks.

- Different risks require different containment procedures. In fact, most risks require expertness on the part of the project manager in handling the risk.
- There are three main strategies to plan for risk containment:
 - **Avoid the risk:** This may take several forms such as discussing with the customer to change the requirements to reduce the scope of the work.
 - **Transfer the risk:** This strategy involves getting the risky component developed by a third party.
 - **Risk reduction:** This involves planning ways to contain the damage due to a risk.
- To choose between the different strategies of handling a risk, the project manager must consider the cost of handling the risk and the corresponding reduction in risk.
- For this we may compute the risk leverage of the different risks. Risk leverage is the difference in risk divided by the cost of reducing the risk.
- **Risk leverage = (Risk before reducing - Risk after reducing) / cost of reducing**

3. DETAIL DESCRIPTION

Admin

The Admin module is responsible for managing the entire Green Gyan system. Admin users can securely log in, manage their profiles, add or update plant details, manage plant categories, and handle user information. Admin control ensures that all data in the system remains accurate and up to date.

- **admin_id:-** ID of Admin.
- **admin_email:-** Email of Admin
- **admin_location:-** Location of Admin
- **admin_name:-** Name of Admin
- **admin_number:-** Number of Admin
- **admin_password:-** Password of Admin
- **admin_updatedAt:-** Updated time of Admin

User

The Users module allows users to register and access the system. Users can log in, edit their profiles, search for plants, view plant details, browse categories, manage their wishlist, and log out. This module focuses on providing a smooth and informative user experience.

- **user_id:-** ID of Employee.
- **user_name:-** Name of Employee.
- **user_username:-** Username of Employee.
- **user_password:-** Password of Employee dashboard.
- **user_createdAt:-** Joining date of Employee.
- **user_number:-** Contact Number of Employee.
- **user_blocked:-** Employee blocked or not.

Plants

The Plants module stores detailed information about plants, including plant name, scientific name, category, care instructions, light requirements, difficulty level, and images. This helps users gain complete knowledge about plants.

- **plant_id**:-ID of plant
- **plant_careInstructions**:-Care Instruction of plant
- **plant_categoryId**:-Category id of plant
- **plant_categoryName**:-Category Name of plant
- **plant_climate**:-Climate for plant
- **plant_date**:-Date of plant
- **plant_description**:-Description of plant
- **plant_difficultyLevel**:-Difficulty level of plant
- **plant_heightRange**:-Height Range of plant
- **plant_image**:-Image of plant
- **plant_lightRequirements**:-Light Requirement for plant
- **plant_region**:-Region of plant
- **plant_scientificName**:-Scientific Name of plant
- **plant_soilType**:-Soil Type of plant
- **plant_spreadRange**:-Spread Range of plant
- **plant_title**:-Title of plant
- **plant_type**:-Type of plant
- **plant_waterFrequency**:-Water Frequency of plant

Wishlist

The Wishlist module allows users to save their favorite plants for future reference. Users can add or remove plants from their wishlist at any time.

- **wishlist_id**:-ID of wishlist
- **wishlist_userid**:-User ID of wishlist
- **wishlist_plantId**:-Plant Id of wishlist
- **wishlist_title**:-Title of wishlist
- **wishlist_category**:-Category of wishlist
- **wishlist_image**:-Image of plant in wishlist
- **wishlist_addedAt**:-Added time of plant in wishlist

Categories

The Categories module organizes plants into different groups, making it easier for users to browse and search plants based on their interests.

- **categories_id**:-Id of categories
- **categories_createdAt**:-Created time of categories
- **categories_name**:-Name of categories
- **categories_nameLower**:-Name in Lower Case of categories

7. CONCLUSION

Green Gyan is a simple and useful plant management application that helps users easily find and understand plant information. It provides a clear and organized platform where users can search plants, view details, and save their favorite plants in a wishlist. At the same time, the admin can manage plants, categories, and user data smoothly.

8. FUTURE ENHANCMENT

In the future, **Green Gyan** can be improved by adding features such as online plant purchasing so users can buy plants and gardening items directly through the application. The system can also include plant care reminders to notify users about watering, sunlight, and fertilizing schedules. Multilingual support can be added so people from different regions can easily understand plant information.
